Roam

Install Roam yourself

The do-it-yourself way with SideStore. You use your own free Apple ID. Takes about 30 minutes the first time.

What you need

- An iPhone with **iOS 27 or newer**
- A **Mac or Windows computer**, just once
- A **cable** for your iPhone
- Your **Apple ID** (a free one is fine)
- **Wi-Fi**
- About **30 minutes**

Prefer no computer and no refreshing? Buy a pass on roamlocation.com and use the easy way instead.

First

How this way is different

You sign the app yourself

An app called **SideStore** puts Roam on your iPhone with your own Apple ID. Apple allows this for free.

Every 7 days a refresh

With a free Apple ID, apps last 7 days. SideStore refreshes them for you when **LocalDevVPN** is on and you're on Wi-Fi.

Max 3 apps

A free Apple ID can have 3 of these apps at once. SideStore counts as one, Roam is the second.

You still need a pass

Roam starts with a free trial. After that, you buy a pass inside Roam.

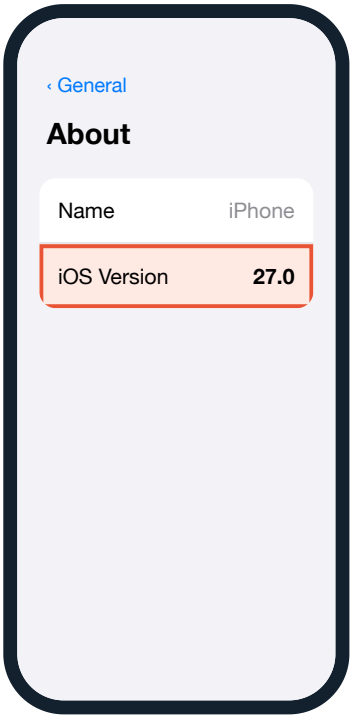

Part 1

Prepare your iPhone

1 Check your iOS version

Open **Settings › General › About**. **iOS Version** must be **27** or higher.

Important Roam does not work on iOS 26 or older.

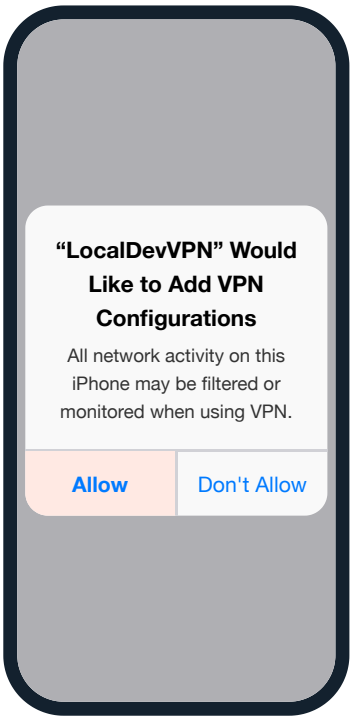

Drawing: your screen may look a little different

2 Get LocalDevVPN

Open the **App Store**, search for **LocalDevVPN** and tap **Get**. It's free.

Open it once and allow it to add a VPN. You'll need it for SideStore and for Roam.

Drawing: your screen may look a little different

Part 2

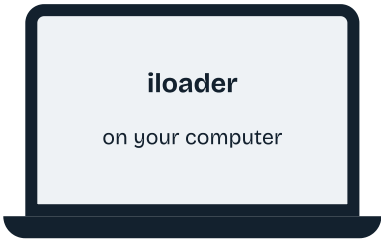

Put SideStore on your iPhone

This is the only part with a computer. You do it once.

3 Download iloader on your computer

On your Mac or Windows computer, download **iloader** (free) from the SideStore website, **sidestore.io**. Open it.

iloader is the helper that puts SideStore on your iPhone.

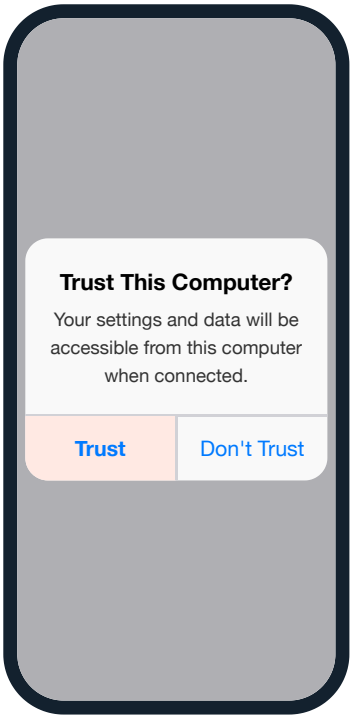

Drawing

4 Plug in your iPhone

Connect your iPhone with the cable. Unlock it.

Your iPhone asks **Trust This Computer?** Tap **Trust** and type your passcode.

Drawing: your screen may look a little different

5 Sign in and install SideStore

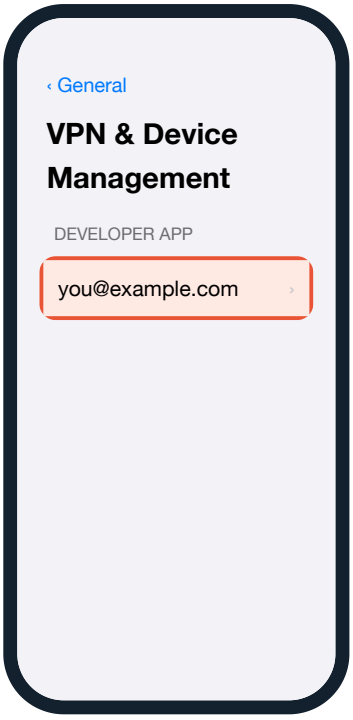

1. In iloader, sign in with your **Apple ID**.
2. Pick your iPhone and choose to install **SideStore**.
3. Wait until it says it's done. iloader also puts the **pairing file** SideStore needs on your iPhone.

Tip Your Apple ID only goes to Apple, to sign the app.

6 Trust yourself on the iPhone

On your iPhone go to **Settings › General › VPN & Device Management**.

Under **Developer App**, tap your Apple ID e-mail, then **Trust**.

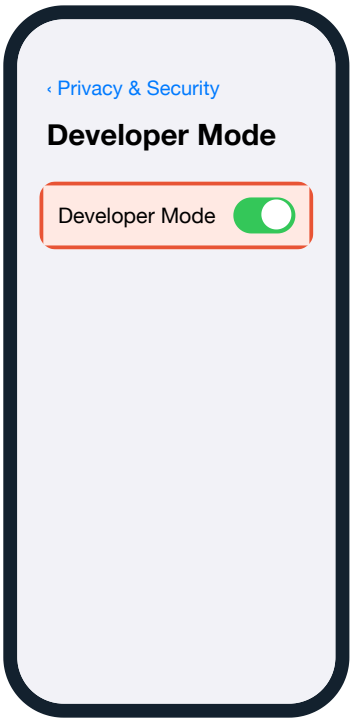

Drawing: your screen may look a little different

7 Turn on Developer Mode

1. Go to **Settings › Privacy & Security** and scroll down.
2. Tap **Developer Mode** and turn it **on**.
3. Tap **Restart**. After the restart, tap **Turn On** and type your passcode.

You can unplug the cable now.

Drawing: your screen may look a little different

Part 3

Add Roam to SideStore

8 Open SideStore with LocalDevVPN on

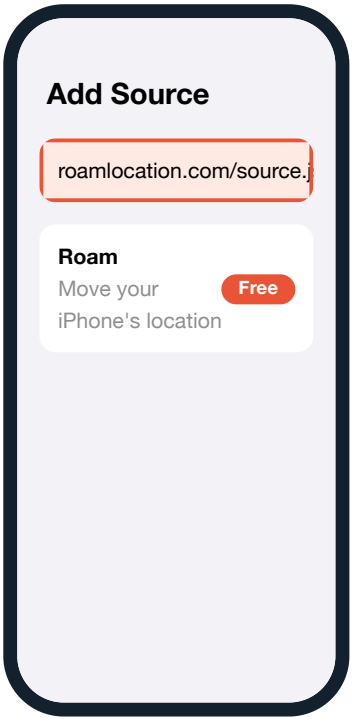

Open **LocalDevVPN** and tap **Connect**. Then open **SideStore** and sign in with the same Apple ID.

Remember SideStore only works while LocalDevVPN is connected.

9 Add the Roam source

1. In SideStore, go to **Sources** and tap **+**.
2. Type **roamlocation.com/source.json** and tap **Add**.
3. Find **Roam** and tap **Free** (install). Wait a moment.

Roam is now on your Home Screen.

Drawing, not the real SideStore screen

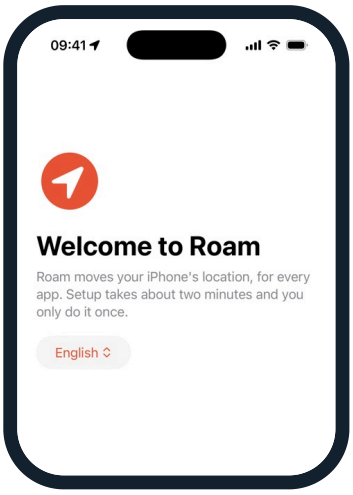

Part 4

Set up Roam

Open Roam. It walks you through a few short screens. You only do this once.

10 Welcome

Pick your language if you want, then tap **Get started**.

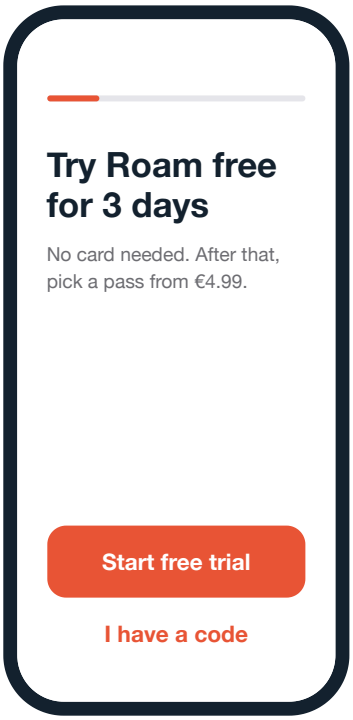

First screen in Roam

11 Start your free trial

Roam says **Try Roam free for 3 days**. No card needed. Tap **Start free trial**.

Already bought a pass? Tap **I have a code**, type it and tap **Activate**.

When the trial ends, Roam shows the passes (from €4.99). Tap one and pay in Safari. Back in Roam, tap **I paid, check again**.

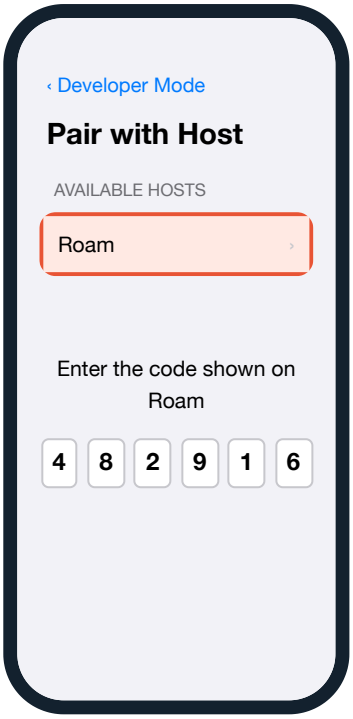

Drawing of the trial screen

12 Connect Roam to your iPhone

Roam needs a one-time “handshake” with your iPhone. Like pairing headphones.

1. In Roam, tap **Start pairing**. Allow **Local Network** if asked.
2. Go to **Settings › Privacy & Security › Developer Mode** and tap **Pair with Host**.
3. Tap **Roam** and type your iPhone passcode.
4. Roam shows a **6-number code** (also in your notifications). Type it in Settings.

Done when Roam says **Paired**. You never have to do this again.

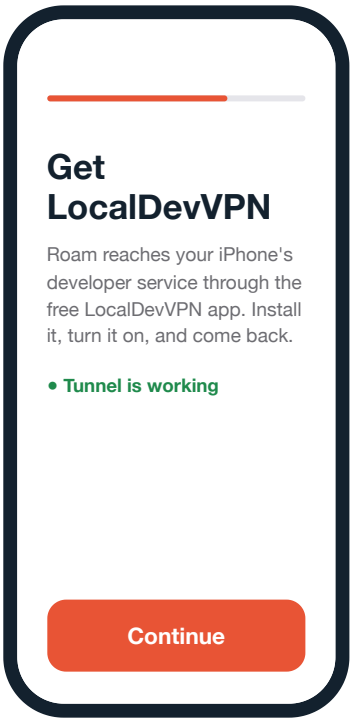

Drawing: your screen may look a little different

13 Turn on LocalDevVPN

Roam talks to your iPhone through the free **LocalDevVPN** app, the same one SideStore uses.

Tap **Turn on LocalDevVPN**. In LocalDevVPN tap **Connect**, then come back to Roam.

Done when Roam says **Tunnel is working**. Tap Continue.

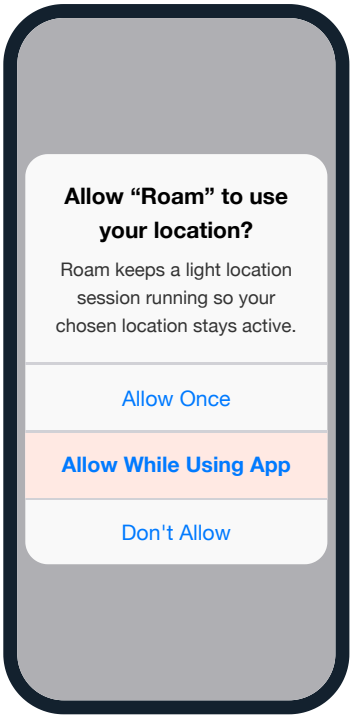

Drawing of the VPN screen

14 Allow location

Tap **Allow location**, then choose **Allow While Using App**.

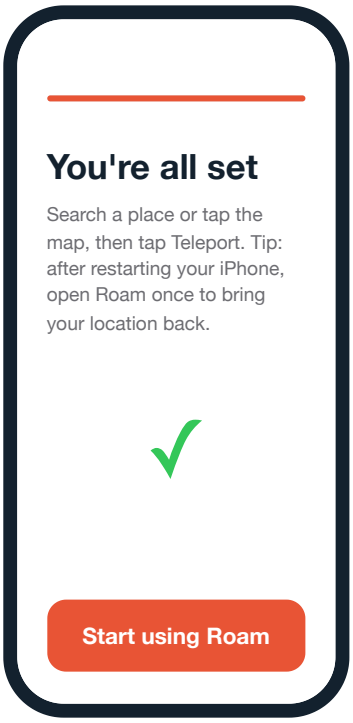

Roam needs this to keep your new place switched on while you use other apps.

Drawing: your screen may look a little different

15 All set!

Tap **Start using Roam**. That's it, the hard part is over.

Drawing of the last setup screen

Part 5

Every 7 days

This is the one thing to remember with this way.

Let SideStore refresh

Keep **LocalDevVPN** connected and be on Wi-Fi. SideStore refreshes Roam in the background.

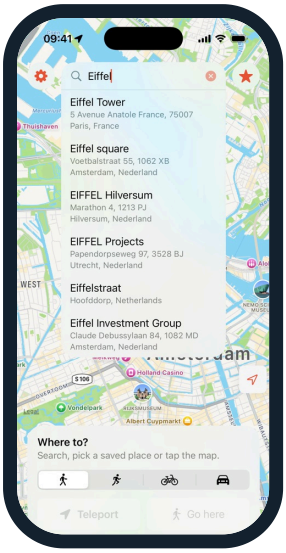

To do it yourself: open SideStore › **My Apps** › **Refresh All**.

Roam won't open? It wasn't refreshed in time. Connect LocalDevVPN, open SideStore and tap Refresh All. Your places are still there.

Part 6

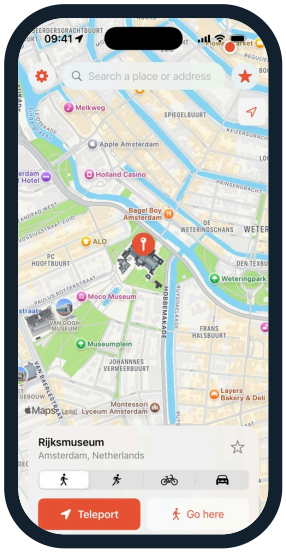

Using Roam

The fun part. You'll get the hang of it in a minute.

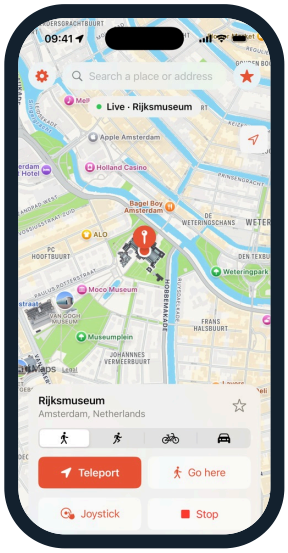

1. Find a place

Type a city, street or address in the search bar at the top. Or press and hold anywhere on the map.

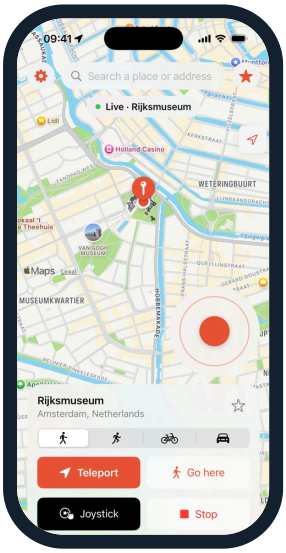

2. Tap Teleport

Your iPhone is there right away. Open Find My or Maps to see it.

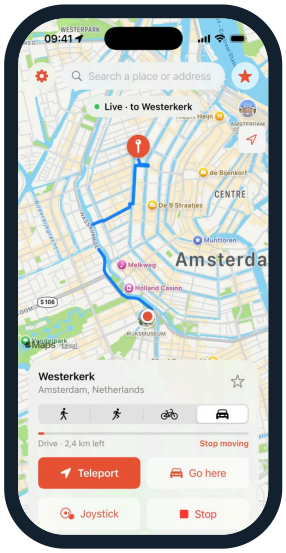

3. Stop when done

"Live" at the top means it's on. Tap **Stop** to go back to your real location.

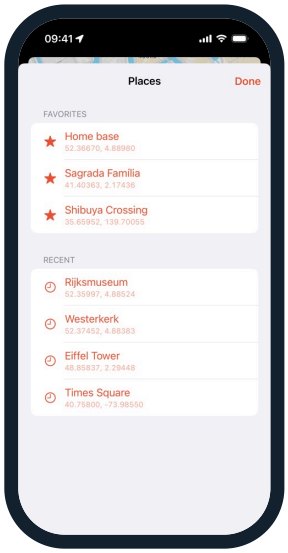

Walk around

Tap **Joystick** and drag the circle to walk. Pick walk, run, bike or car for the speed.

Follow a route

Pick a place and tap **Go here**. Roam moves along real roads, at the speed you chose.

Save your favourites

Tap the ☆ on a place to save it. The ★ button top right shows your saved and recent places.

Tip After you restart your iPhone, open Roam once. It brings your chosen place back by itself.

Good to know

How Roam works

You don't need to understand this to use Roam. But it's nice to know what happens.

📍

Your iPhone knows where it is

Normally it uses GPS, Wi-Fi and cell towers.

🛠️

Apple built a test switch

App makers use it to test their apps in other places. It's called Developer Mode.

🗺️

Roam uses that switch

You pick a place, Roam tells your iPhone: “pretend you're here.”

📱

Every app follows

Maps, Find My, Weather and the rest all see the new place.

Is this a hack or a jailbreak?

No. Roam uses the same tool from Apple that app makers use (Xcode). Your iPhone stays normal and safe.

What is the small VPN for?

Roam talks to your own iPhone through it. It stays inside your iPhone. Your internet doesn't go through it.

Can apps see it's not real?

iOS marks the location as “simulated”. Most apps don't look, but some can. Games and some apps forbid it, so don't use Roam there.

Does my location go to you?

No. Your places stay on your iPhone. Roam doesn't track you.

Help

If something goes wrong

SideStore says it can't connect

Open LocalDevVPN and tap Connect. Be on Wi-Fi. Then try again.

“Untrusted Developer”

Do step 6 again: **Settings › General › VPN & Device Management**, tap your Apple ID, Trust.

Roam won't open, it talks about Developer Mode

Do step 7 again and restart.

Pairing in Roam doesn't work

Allow Local Network for Roam in **Settings › Roam**, keep Wi-Fi on and tap Start pairing again.

My location jumped back

Open Roam. It reconnects by itself. After restarting your iPhone, open Roam once.

Still stuck?

Go to **roamlocation.com** and tap the chat bubble.
